

## Bias & Variance - Model Performance Tuning

17 August 2024 21:57

### Bias

Prejudice

Bias represents how much the model is inclined to interpret the data in a certain way before seeing the data itself.

In simple terms, bias is the difference between the predicted and actual value (expected)

- # A model with a higher bias would not match the data set closely.
- # A low bias model will closely match the training data set

### Variance

- is the variability of predictions i.e., how spread out model predictions are.

K-fold CV: K-fold cross validation

variance refers to changes in the model predictions when using different portions of the training data set.

@apc

Nokia 1600

simple

very less features

Samsung Ultra

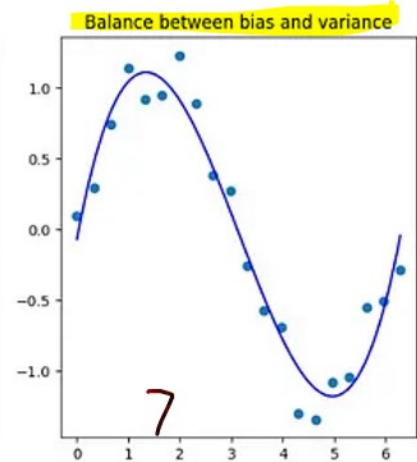

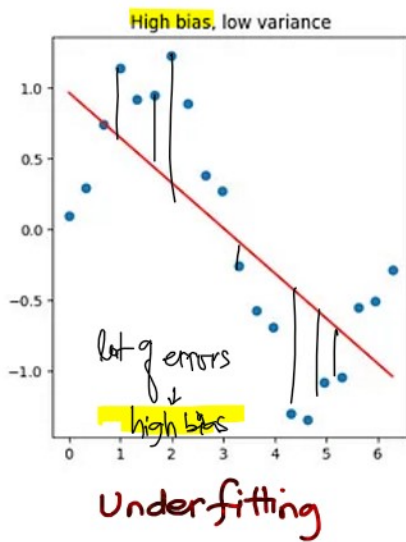

complicated

[lots of features > 100]

very less 10 features  
(low variance)

[lots of features > 100]  
↓  
(high variance)

# K-fold cross validation  
Approach #1

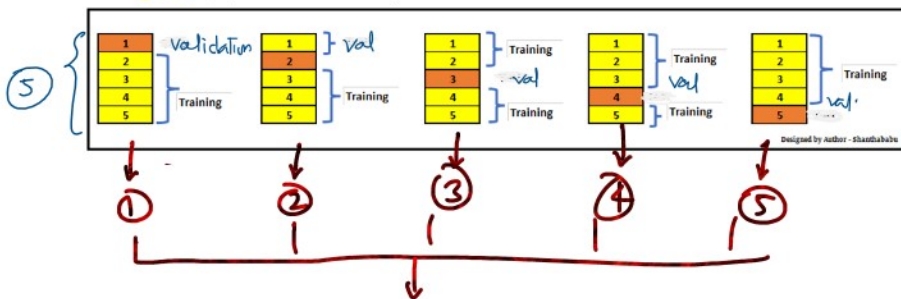

random sampling  
and select 80% of data for training  
and 20% of data for validation.

## Approach #2

K=5 fold cross-validation

## Approach #2

K(K=5) fold cross-validation

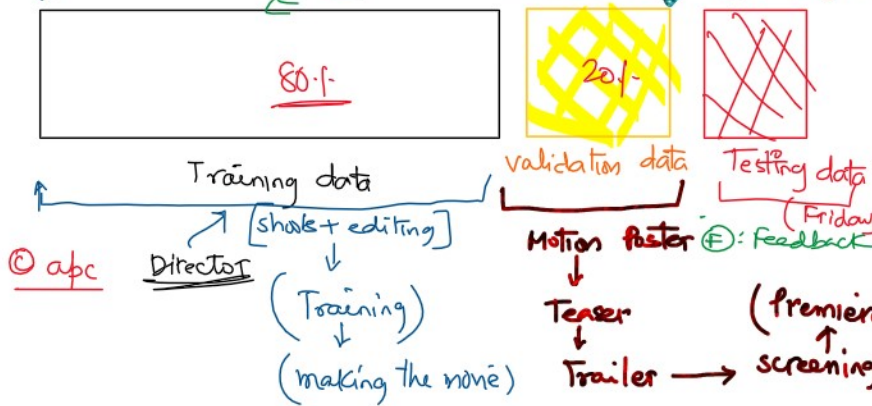

(avg. validation frequency) → Robust way of validation

Model: Movie

dataset

(deploying the model to prod)

Training # 3 years Jan'21 - Dec'23  
Validation # Jan'24 - Jul'24

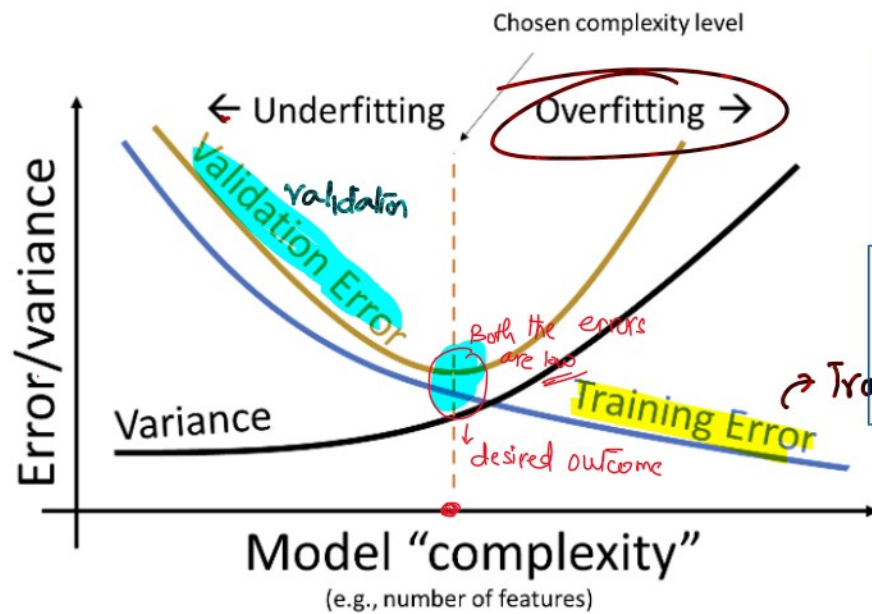

$$P \quad A$$

$$(200 - 300)$$

$$= \frac{100}{300} \times 100$$

$$Error = 33.33\%$$

M	S.F.	Actual
Aug	200	300
Sep	150	180
Oct	180	200
Nov	-	110
